Bekzat Uraimov

bkzturaimov@gmail.com • Seattle, WA • bekzat.dev • github.com/bekzat-uraimov • linkedin.com/in/bekzat-uraimov

Education

Bellevue College — Bellevue, WA
Bachelor of Science in Computer Science — *Sep. '26 – Jun. '28*
Relevant Coursework: Python for Data Science, Data Structures (C++)

Cascadia College
Associate Degree, Direct Transfer (DTA), GPA: 3.51 — *Mar. '25 – Aug. '26*

Work Experience

ONER • Remote — May '26 – Present
Backend Engineer & Co-founder
Backend of a filmmaking course platform for Central Asia, preparing for launch (FastAPI, PostgreSQL, Docker)
⇒ **Payments:** Payment providers can resend a webhook and students double-click "buy", so before a course opens I check each webhook 3 ways (signature, amount, duplicate) and reuse the order on a repeat click. No double charges.
⇒ **Access control:** Browser code can be changed, so the server checks every lesson request (JWT login plus ownership).
⇒ **Video security:** Course videos are what students pay for, so they play through Kinescope DRM with short-lived tokens that only course owners get. This makes them hard to download or share.
⇒ **Admin tools:** So the team can run the platform without me, I built an admin API for courses, users and refunds.

Metr Production Studio • Kyrgyzstan — Mar '19 – Feb '23
Director and Colorist
⇒ **Client projects:** Planned each commercial with the client, put together a crew for each shoot, and led it to the result.
⇒ **Mentoring:** Trained junior editors and managed deadlines from shoot to the final edited and color graded video.

Projects

llm-failover — Oct '26 – Present
Fault tolerant inference service (C++, Python, TCP, llama2.c)
When an LLM server crashes, the answer it was writing is lost. This service keeps the answer going.
⇒ **Recovery:** The router logs every token, so if a worker crashes, another one finishes the same answer, byte for byte.
⇒ **Design choice:** Save only the tokens and random number state (1 KB vs 3.5 MB for the KV cache, about 3,000x less) and rebuild the rest by replay, trading some recovery time for much less saved state.

ThinkCoder — Mar '26 – May '26
Kurultai R&D Club project (Python, LiteLLM, Ollama)
An AI coding assistant built by a student team. My part was the layer that picks which model answers each request.
⇒ **Cost:** Easy questions go to a free local model, hard ones to a paid cloud model, cutting estimated spend about 40%.

Heart Disease Classification • Python, scikit-learn, XGBoost — Oct '26
⇒ Compared logistic regression and XGBoost on 297 patients. XGBoost overfit (100% train vs 85% test), while an L2-regularized logistic regression held up better on unseen data.

Hackathons

Poly Predictor Kit • Polymarket Track Winner, QuackHacks (Univ. of Oregon) — Nov '25
⇒ Led a team of 6 to build a Chrome extension that explains Polymarket events with AI and rates comments as emotional or rational. I built the comment collector that feeds our model.

AI Visual Novel Creator • Best Use of AI, CodeDay Fall 2025, Seattle — Nov '25
⇒ Team of 6 built a game that turns one prompt into a playable visual novel. I built the Ren'Py game loop.

Skills

Languages & Backend:	Python, C++, Java, SQL, FastAPI, Flask, REST APIs, JWT auth, PostgreSQL, pytest
Machine Learning:	scikit-learn, XGBoost, pandas, linear and logistic regression, L1/L2 regularization, cross-validation
Systems & DevOps:	TCP sockets, multi-process services, fault tolerance, Docker, Git, GitHub Actions, Cloudflare R2
